

The paper which proposes a novel method that could be utilized to attract the attention of, and ultimately communicate with extraterrestrial intelligence is Transit Light-Curve Signatures of Artificial Objects which proposes a new idea for SETI to discover extraterrestrials. This paper speculates that advanced extraterrestrial civilizations could construct artificial, planet-sized structures designed to transit their host stars. These structures could be anything like simple geometric shapes to more complex multi-panel or louvre-like which would produce unique lightcurve signature.
